

February 24, 2011

**Case Narrative: LBI Renewables**

**Project: Bioremediation Effectiveness**

**Sample: DualZorb**

A bioremediation agent, known as "DualZorb", was submitted to Bonner Analytical Testing Company (BATCO) on 12/15/10. LBI Renewable requested that the sample be tested for bioremediation effectiveness to determine candidacy for the Environmental Protection Agency's National contingency Plan Product Schedule. The product was tested according to Title 40 of the Code of Federal Regulations Part 300 Appendix C. QI macros is the name of the statistical software used to perform the ANOVA tables and the LSD.

The testing of the product began on December 22 2010. The testing groups per testing day (0, 7, and 28) consisted of 3 replicates of controls, 3 replicates of nutrients and 3 replicates of the treated sample (DualZorb with nutrient). The controls consisted of 100mL of natural seawater and 500mg of Alaska North Slope crude oil weathered at 521°F (ANS 521). The nutrient group consisted of 100mL of nutrient enriched seawater and 500mg of ANS 521. The product group flasks consisted of 100mL of nutrient enriched seawater, 500mg of ANS 521, and the DualZorb 1215 with nutrient product at an application rate of 0.6026 g as requested by the client.

At each sampling event (Day 0, 7, and 28) the control, nutrient and product groups underwent microbiological, gravimetric, and chemical analyses. The raw data obtained from these analyses is included in this report. The samples were prepared for the chemical analysis and gravimetric analysis by extracting the control and product groups with 50mL of methylene chloride. 1/5 of the extract was placed into a tared scintillation vial for the gravimetric analysis.

A 1mL aliquot of each sample was analyzed by way of Gas Chromatography/Mass Spectrometry (GC MS). Prior to analysis, an instrument method had to be developed in order to create optimum conditions for sample analysis. The instrument's configuration was optimized yielding 63 minute runtimes. The linear 5 point standard curve that we achieved using this configuration permitted us to begin analyzing samples and quality controls.

DualZorb and nutrient from Day 0 and 7 were analyzed at a 4X dilution and Day 28 was analyzed at a 2X dilution. All controls were analyzed at a 4X dilution. All control, nutrient and product groups, including Day 0, 7 and 28, underwent the Solid Phase Extraction Alumina clean-up procedure and were therefore analyzed undiluted. The concentrations of the target analytes, total aliphatics, and total aromatics were determined according to the equation 7 found in Title 40 of the Code of Federal Regulations Part 300 appendix C. The results can be found in the raw data section of the report. The code of Federal Regulations provided a significant list of compounds to include in the 5 point standard curve. The following compounds were not listed by the CFR; moreover, this methodology also does not provide characteristic ions associated with these compounds nor reference compounds. As a result, the following compounds were not quantifiable according to this methodology: The naphthobenzothiophenes, benzo (a) anthracene, and perylene. The concentrations of compounds associated with weathered Alaskan North Crude varies. The lighter alkanes tend to be absent in abundance or in totality; consequently, those same compounds tend to be absent in all of the sample groups.

## **Results:**

GCMS Summary worksheet:

Alkanes show data that reflects an effective product. As the graph shows, concentrations are nearly constant for the control group, fall off quickly for the nutrient group, and fall off even more rapidly for the product group. Note that, while the graph looks as if product and

nutrient and at roughly the same level, in fact, product, day 28 is significantly lower than nutrients, Day 28.

Aromatics also reflect an effective product. Here, both the control and nutrient groups are comparatively level. While the product group seems to start out slow, it is actually lowering the concentration over the first, seven-day interval significantly faster than the other two groups. This pace picks up significantly over the last 28 days.

Alkanes ANOVA worksheet:

P-values reflect an extremely high level of confidence based on extremely consistent data. Fisher tests further reflect test viability. With a least significant difference of 114,058.3, there were two T groups. If the least significant difference had been marginally lower, there would have been three groups as is reflected by the graph. However, the graph and groupings show significant alkane results for day seven and day 28 product, as well as day 28 nutrient. The fourth member of the B group, nutrient day seven, while much lower than the means from group A is significantly higher ( an order of magnitude ) than the other three values in the B group.

Aromatics ANOVA worksheet:

P-values, again, reflect high confidence levels. 99.97% confidence for the columns row was the lowest level of confidence. Fisher tests validate the T groups, which are very well delineated. Note the groupings in the graph, clearly showing that product, day 28 is well separated from every other value.

Approved By: 

Michael S. Bonner, Ph.D.
